Update Domain

Updates configuration for an existing custom domain in your account.

Endpoint

> POST v5/domain/{domain_id}

Requires authentication

Path Parameters

The domain to update.

domain_id

string

required

The ID of the domain to update.

Query Parameters

All query parameters are optional. Supply only the fields you want to change.

domain

string

The domain URL to register. Domains must be between 3 and 63 alphanumeric or hyphen characters. Your domain will automatically end with: `.alchemer.com`

type

string

The domain type. Accepted values: `Private` , `Subdomain` (case sensitive).

redirect

string

The survey-not-found redirect URL (e.g. `company.com`). Applies to Private domains only.

Response

Returns the updated domain record nested under its domain ID key.

result_ok

boolean

Whether the request succeeded.

data

object

A keyed object containing the updated domain record, where the key is the domain ID.

- ▼ child attributes

id

integer

The unique ID of the domain.

customerID

string

The account (customer) ID this domain belongs to.

type

string

The domain type. Possible values: `Private` , `Subdomain` .

domain

string

The domain URL after the update.

redirect

string

The survey-not-found redirect URL. Empty string if not configured.

eStatus

string

The domain status (e.g. `Active`).

created

string

Timestamp when the domain was originally created.
